                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     δ
                                                   The invention comprises nucleic acids (e.g. antisense oligonucleotides) that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NOGO, prostaglandin Dz receptor (PTGDR). RappaB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrovascular accident, central rervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma, inflammatory disease (e.g. rheumatoid arthritis, restenosis or asthma), Crohn's disease (e.g. rheumatoid arthritis, and altergic disease, lupus, multiple sclerosis, transplant/graft rejection, corditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The mucleic acids of the invention are also useful for down-regulating the cappession of a target gene and as a diagnostic tool to examine genetic drifts and mutations within diseased cells or to detect the presence of a carget RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Best Loc

                                                                                 of breast cancer comprising detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a subject at risk of breast cancer, for early diagnosis, prevention and treatment of breast cancer, possibly via gene therapy, as well as to analyse and predict a response to a breast cancer treatment and in clinical drug trials. The current sequence is that of an Extend primer (also described as probe) the invention which was used to genotype human Rho family guanine-nucleotide exchange factor KIAAO861 gDNA which has been mapped to

                                                                                                                                                                                                                                                                                                      The present oligonucleotide reduces T cell CD28 gene expression, useful in the treatment of CD28 mediated diseases, particularly immune system disorders, e.g. graft versus host disease, septic shock, viral disease, psoriasis, type I diabetes mellitus, thyroiditis, sarcoides, multiple sclerosis, uveitis, rheumatoid arthritis, systemic lupus erythematosus, inflammatory bowel disease, etc. . Reducing CD28 expression may reduce effects of antigenic stimulation of CD28 positive T cells, with a consequent reduction in cytokine release. (Updated on 25-MAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                 vilgo:nucleotide which reduces CD28 gene expression in T cells - for treating immune system diseases, e.g. graft vs. host disease, septic shock, psoriasis, etc.

The method comprises subcutaneous administration of an oligonucleotide (CGN). AAX90288 to AAX90291 represent specifically claimed OGNs for use in the method. The OGNs are used for the treatment of immune system-mediated diseases. AAX90292 to AAX90323 represent oligonucleotides used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 18

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       lymphocytic leuksemia and acute myelogenous leuksemia; as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder related sequences and their complements; and as primers for the amplification of haematopoietic cell proliferation disorder related D sequences. The nucleotide sequences from the present invention can all be used for detecting a predisposition to, differentiation between subclasses, diagnosis, prognosis, treatment and/or monitoring of haematopoietic cell proliferative disorders. The present method enabl highly specific classification of haematopoietic cell proliferative disorders allowing for improved and informed treatment of patients
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method for detecting and differentiating between haematopoletic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target mucleic acid in a biological sample obtained from the subject with at least 1 reagent, biological sample obtained from the subject with at least 1 reagent,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    which distinguishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid. ABZ019861 to ABZ11118 represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells; for differentiating between acute
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim

Preventing melanoma in a subject comprises detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a subject; and administering a melanoma preventative to a subject in need thereof based upon the presence or absence of the one or more polymorphic variations in the nucleic acid sample. The preventative reduces ultraviolet (UN) light exposure to the subject. The methods, nucleic acids, proteins, and compositions are useful for treating melanoma. The present sequence represents a human cyclin-dependent kinase 10, CDK10, proximal SNP probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying a subject at risk of melanoma, useful for treating melanoma, comprises detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of identifying a subject at risk of melanoma comprising detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Example

The method comprises determining the genotype of an affected individual with at least one polymorphic marker localised within the chromosomal region defined by and including markers D18S843 and D18S869 and determining the genotype associated with increased susceptibility to MD disorder. The method can be used for determining susceptibility to MD illness including bipolar disorder, genetic counselling of individuals from families affected with MD illness, and aid in the differential diagnosis of MD illness from other psychiatric pathologies. Products from the present invention can also be used to obtain modulators of IMP.189 myo- inositol monophosphatase protein activity and as targets for preventive and therapeutic treatments. The present sequence represents a PCR primer from

SEQ ID NO 164; 259pp; English

(UYQU) UNIV QUEENSLAND

```
Crimbed on each side by four 2'-O-methyl RNA residues that inhibits the cexpression of an inhibitor-of apoptosis (IAP) in the cell. Also described: (1) a pharmaceutical composition (II) comprising (I) and a carrier; (2) a catalytic RNA molecule (III) capable of cleaving XIAP, acid encoding one or more (III) positioned for expression in a mammalian cell; (4) a double-stranded RNA molecule (III) comprising a nucleic corresponding to a sequence comprising 1 positioned for expression in a mammalian comprision of 21-29 corresponding to a sequence comprising 1 pucleotides, as given in comprise at least eight consecutive nucleobases that comprise at least eight consecutive nucleobases corresponding to a sequence fully defined in the specification, comprising, e.g. 19 cop domain situated between the first admain are capable of duplexing to form the double-stranded hairpin RNA molecule; and (6) an expression vector (VI) comprising a nucleic acid molecule; and (6) an expression vector consecutive, and can be used in antisense therapy. (I) is useful for enhancing the apoptosis of a cell in an animal, preferably human consecutive molecule positioned for expression of an IAP in the cell. (I) is also useful for treating an animal having a cancer or lymphoproliferative disorder. The cancer includes acute myelobases cute leukaemia, acute myelocytic leukaemia, between the myelomonocytic leukaemia, chronic myelocytic leukaemia, between the myelomonocytic leukaemia, cutte entre of larctinoma, lung carcinoma, lung carcinoma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          nucleic acid sequence amplification, for genetic testing or facilitating multiplex PCR amplification from limiting amounts of target nucleic acid. The methods are also useful for improving genetic diagnostic and screening methods, such as prenatal diagnostic testing, foetal sex determination or genetic identification, e.g. DNA profiling or DNA fingerprinting. The nucleic acid sequence amplification is also useful in forensic analysis of degraded, old, ancient and difficult samples that are difficult to amplify and identify. This sequence represents a PCR are difficult to amplify and identify.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Selecting genetic markers as targets for nucleic acid sequence amplification, useful for improving genetic testing, e.g. fetal sex determination, comprises selecting each of the genetic markers according to a heterozygosity index.
                                                                                                                                                                                                                                                                                   Fascin; regulatory sequence; human; dendritic Cell; dictated, comments antibacterial; antifungal; antiparasitic; anti-allergic; neurological; immunomodulatory; apoptotic; expression regulator; vaccine; allergen; Creutzfeld-Jakob disease; Alzheimer's disease; gene therapy; antoimmune disease; transplant rejection; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes a method of selecting genetic markers as targets for nucleic acid sequence amplification comprising selecting each of the genetic markers according to a heterozygosity index of 0.5 or greater. Selecting and amplification of genetic markers are useful as targets for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 36; Page 39; 64pp; English

New regulatory sequences from the fascin gene, useful for providing dendritic cell-specific expression of e.g. antigens, e.g. for vaccination against tumors and infections.

Claim 2b; Page 108; 117pp; German.

cc used to regulate expression of antigens, immunoregulators, antisense cc sequences etc. in DC-specific fashion. Recombinant DNA, vectors and host cells that contain (A) are useful: (i) in vaccines against viruses. CC bacteria, fungi, parasites, tumors, allergens and plaques in Creutzfeld-cyclakob and Alzheimer's disease; and (ii) for gene therapy of tumors, allergies, infections, autoimmune diseases and transplant rejection. They CC allergies, infections, autoimmune diseases and transplant rejection. They CC an also be provide specific expression of antigens and immunoregulators cc in DC; for isolation and identification of cell factors and cis-elements cf rom regulatory sequences that mediate DC-specific expression; to cetermine the degree of maturity of DC and to block transcription cc factors, by providing binding sites in DC. (A) provide DC-specific expression of nucleic acid under their control, allowing a more specific cegulation of the immune response and eliminating the long and laborious purification of DC (since a complete leucocyte population may be control, acid to the immune response and eliminating the nucleic acid under their control. This sequence represents control acid to the invention to the invention of the immune response and eliminating the nucleic acid under their control according to the invention to the invention of the invention to the invention of the invention of the invention to the control according to the invention to the transformation that the invention to the transformation the invention to the transformation that the invention to the inventi allergic, This invention describes novel regulatory sequences (A) derived from human fascin that provide specific expression in dendritic cells (DC) which primer have antiviral, associated with the human fascin gene described in neurological, antibacterial, immunomodulatory antifungal, antiparasitic, anti-tory and apoptotic activity. (A) are the invention and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC The invention relates to antisense oligonucleotides targeted to a nucleic CC acid molecule encoding human Survivin, where the antisense CC oligonucleotide inhibits the expression of human Survivin. These CC antisense oligonucleotides are used in the treatment of an animal CC suffering from a disease or condition associated with Survivin, e.g. a CC hyperproliferative condition such as cancer, and comprises administering CC atherapeutically or prophylactically effective amount of the antisense CC oligonucleotides con that expression of Survivin is inhibited. The CC disease or condition characterised by a reduction in apoptosis comprising administering the antisense oligonucleotide to the antisense oligonucleotide condition, the CC antisense oligonucleotide and a cytotoxic chemotherapeutic agent e.g. CC taxol or cisplatin, can be used to modulate apoptosis, cytokinesis or the CC cell cycle, or inhibit the proliferation in a cancer cell by contacting CC cell cycle, or inhibit the proliferation in a cancer cell by contacting CC cell cycle, or inhibit the proliferation in a cancer cell by contacting CC cell cycle, or inhibit the proliferation in a cancer cell by contacting CC cell cycle, or inhibit the proliferation in a cancer cell by contacting CC cell cycle, or inhibit the proliferation in a cancer cell by contacting CC cell cycle, or inhibit the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to isolated nucleic acids encoding polypeptides. CC designated NOVX polypeptides. The NOVX polypeptide and nucleic acid are CC useful for treating cardiomyopathy, atherosclerosis, diabetes or a CC disorder related to cell signal processing and metabolic pathway CC modulation. The NOVX polypeptide, nucleic acid and antibody are useful CC for treating or preventing a syndrome, e.g., various tissue/organ CC inflammation, muscular dystrophy, neurological and neurodegenerative CC diseases, cardiovascular diseases, coagulation disorders, cancers CC (leukaemia, adenocarcinoma), multiple sclerosis, respiratory diseases, CC (reproductive disorders, allergy, seizures, mental depression, epilepsy, CC gastro-intestinal diseases, bone disorders, nephrological disorders, CC urinary system disorders, immunological disorders, Addison's disease, CC urinary system disorders, immunological disorders, Addison's disease, CC migraine, dermatomyositis and bronchitis. The present sequence is a PCR CC sequence is incorrectly referred as SEQ ID NO: 75 in page 168 of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC The invention relates to a method of judging the onset risk of diabetes CC comprising detecting a haplotype consisting of gene polymorphism at 1 or CC more positions selected from (a)- (h) from a specimen containing human CC genomic DNA supplied by a patient: (a) the nucleotide located at position 36 of the intron 1 on GFAT1 (glutamine:fructose-6-phosphate amide CC transferase 1) gene (nucleotide number 632 in sequence ADD71329; (b) the CC (nucleotide located at position 7 of the intron 11 on GFAT1 gene (nucleotide located at position -147 of the intron 12 on GFAT1 gene (nucleotide number 336; (c) the nucleotide located at position ron the nucleotide located at positions 1853-1877 of CC sequence ADD71331; (d) the nucleotide numbers 3360 in sequence CC ADD71332; (e) the nucleotide located at positions 1988-2007 of the intron 12 on GFAT1 gene (nucleotide numbers 328-347 in sequence ADD71333; (f) CC the nucleotide located at position -11 to -22 of the intron 18 on GFAT1 gene (nucleotide numbers 225-264 in sequence ADD71334; (g) the nucleotide considers 237-266 in sequence ADD71335; and (h) the nucleotide located at positions 2632-2661 of the intron 3 on GFAT1 gene (nucleotide number 225 in CC sequence ADD71351). The method is useful for judging relative onset risk of diabetes accompanying. This sequence represents a PCR primer used CC in the sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The DNA sequences of the invention are useful for assessing, modifying, modulating or regulating intestinal epithelium or M cell development. The DNA sequences of the invention are also useful in the treatment of: inflammatory bowel disease, glutenenteropathy, infectious diseases, autoimmune diseases (e.g. haemolytic anaemia, rheumatoid arthritis, dermatitis, Grave's disease, multiple sclerosis, allergy, asthma and diabetic mellitus), diseases or disorders of the immune system, hypersensitivity, diseases or disorders of the immune system, hypersensitivity, anaphylaxis, and blood group incompatibility. The present DNA sequence represents a PCR primer that was used to amplify an intestinal epithelium/peyer's patch M cell-associated DNA sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      gene typing; polymorphic microsatellite loci; PML; disease predisposition; microsatellite marker; prion disease; cystic fibrosis; malignant hyperthermia syndrome; metabolic disease; milk protein; hormone; transcription factor; pT7-blue-vector; human;
                                                 The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises PCR amplification of at least one DNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I); and determining the length of the resulting amplicon(8). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ADO81026 standard; DNA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              diseases and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, hormones or transcription factors. The method is simpler, quicker and particularly less expensive than known methods based on sequencing. This sequence represents a primer used to genotype a region of the human prion protein (PrP) comprising a polymorphic microsatellite locus.
                                                                                                                 Sequence 41 BP; 6 A; 16 C; 9 G; 10 T; 0 U; 0 Other;
                                                                                                                                                        The invention relates to a human protein designated 10.01, containing the Phe-His aminolyase active site. Also disclosed are the encoding polynucleotide, and a method for preparing the polypeptide by DNA recombination. The application of the polypeptide is in treating arrhychmia and diabetes. Also disclosed are the antagonist against this polypeptide and its therapeutic action, and the application of the polypucleotide. The current sequence represents a human protein 10.01
                                                                                                                                                                                                                                                                                                          New human protein 10.01 containing Phe-His aminolyase active site and encoding polynucleotide, useful for treating arrhythmia and diabetes.
                                                                                                                                                                                                                                                                                                                                                       WPI; 2002-529811/57.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide CC sequences (I), which contain single nucleotide polymorphisms (SNPs). CC AAM53114 to AAM5329 represent peptides related to human polymorphic CC polynucleotide sequences. The sequences can be used in gene and protein them may be used in the prevention. (I) and the polypeptides encoded by CC them may be used in the prevention, diagnosis and treatment of diseases CC associated with inappropriate expression of polymorphic polypeptides. For CC deletions in a patient's genome that affect the activity polypeptides or CC deletions in a patient's genome that affect the patients own CC production of polypeptide. Additionally, (I) and its complementary CC sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and CC therefore which patients may be used as antigens in the production of polypeptides may be used as antigens in the production of polypeptides expression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                Query Match

The STSs and cosmids were mapped by in situ hybridisation, somatic cell hybrid analysis or both. Using this method, 370 STSs specific for human chromosome 11 were generated and most of them were regionally mapped. This procedure illustrates a novel method for sequencing complex genomes, designated "sequence sampled mapping". The sequence sampled mapping method is useful for the completion of high density sequence-based maps, and ultimately, for the complete sequencing of genomic DNA directly from cosmid clones. See AAQ82001-Q82706 and AAQ91325-Q91338 for STS primers. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sequence sampled mapping; genomic analysis; complex genome mapping;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequences were determined from the ends of chromosome 11-specific cosmids by automated sequencing without intermediate subcloning. A sample of 371 DNA sequence fragments were determined and of these, 277 were suitable for STS primer prediction by computer analysis (using the "Primer"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 4; Page 90; 128pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                15-JUN-1993;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Analysis of cDNA and gene expression -
by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 16-APR-1993;
                                             Kit for automated genotyping contg. pairs of PCR primers - designed to amplify polymorphic nucleotide repeat sequences, arranged in sets each with a characteristic fluorescence label, useful e.g. in detection of disease related genetic rearrangement.
                                                                                                                                                                                                                                                                                                                                 primer; polymerase chain reaction; PCR; linkage study; locus;

The MMS are polymorphic, simple sequence repeats and can be used in automated genotyping. esp. fluorescence-based. The primers correspond to the unique DNA sequence surrounding each marker, and PCR is used to detect each polymorphism. When the MMS show considerable polymorphism (ie. a difference in the number of repeats) between individuals, the markers can be particularly informative. The MMS can be ideal for linkage studies. Kits comprise at least 4 groups, of at least 3 sets, each comprising labelled primers for PCR amplification of the DNA. Group 10 primer pairs are shown in AAQ95819-40. The published size range of the D13S164 allele is 208-219 bp, and the degree of heterozygosity in the population is
The sequences given in AAT10742-67 are synthetic oligonucleotides which are used in the construction of the electronically self- addressable device (ED) of the invention. The ED comprises a substrate, an electrode or opt. a number of electrodes supported by the substrate, a current source operatively connected to the electrode and an attachment layer adjacent to the electrode which is permeable to a counterion but not permeable to a molecule capable of insulating or binding to the electrode. The attachment layer is capable of attaching a macromolecule.
                                                                                                                                                                                                                                                                           Electronically self-addressable device e.g. nucleic acid hybridisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           modified_base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Key

                                         The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) probe. Over 100 repeat blocks were isolated. The primers AAT65798-T66047 were used to PCF amplify the inserts from the isolated clones containing the repeat sequences. The primers AAT66018-9 were used to amplify the repeat sequence marker clone Mfd111 (AAT65782). (Updated on 25-MAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The ED is used for genetic typing and comprises a number of electronically addressable locations each comprising an electrode, binding entity, such as one of these probes, attached to each of t locations capable of detecting the presence of a genetic sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence

                                                                                                                              The present invention describes LRP5 (low density lipoprotein (LDL) receptor related protein, previously designated LRP-3). AAV85587 to AAV85822 represent exon primers used for obtaining LRP5 CDNA. Nucleic acid molecules (NAMS) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMS or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in the treatment of autoimmune diseases such as glomerulonephritts, diseases and disorders involving disruption of endocytosis and/or antigen presentation, cytokine clearance and/or inflammation, viral infection, pathogenic bacterial toxin contamination, elevation of free fatty acids or hypercholesterolemia, type 2 diabetes, osteoporosis, Alzheimer's disease and cardiovascular disease. Products from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                            Todd JA, Hear
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          hypercholesterolemia; Alzheimer's disease; low density lipoprotein; hypercholesterolemia; Alzheimer's disease;
                                                                                                                                                                                                                                                                                                                                New isolated LDL-receptor related protein - used to develop products treating, e.g. elevated triglyceride levels, diabetes, autoimmune disorders, inflammation or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             15-APR-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  LRP5; LDL-receptor related protein; LRP-3; IDDM; diagnosis; endocyt insulin dependent diabetes mellitus; autoimmune disease; glomerulonephritis; inflammation; viral infection; osteoporosis; hypercholesterolemia; Alzheimer's disease; low density lipoprotein;
                                                                                                                                                                                               The present invention describes LRP5 (low density lipoprotein (LDL) receptor related protein, previously designated LRP-3). AAV85823 to AAV85900 represent SNP primers used for obtaining LRP5 cDNA. Nucleic acid molecules (NAMs) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMs or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in the treatment of autoimmune diseases such as glomerulonephritis, diseases and disorders involving disruption of endocytosis and/or antigen presentation, cytokine clearance and/or inflammation, tral infection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAV85825;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAV85825 standard; DNA; 19
                                                                                                                                                      pathogenic bacterial toxin contamination, elevation of free fatty acids or hypercholesterolemia, type 2 diabetes, osteoporosis, Alzheimer's disease and cardiovascular disease. Products from the present invention
                                                                                                                                                                                                                                                                                                                                                                                     New isolated LDL-receptor related protein - used to develop products for treating, e.g. elevated triglyceride levels, diabetes, autoimmune disorders, inflammation or Alzheimer's disease.

                                                                                                                                                                                                                                                                    the treatment of autoimmune diseases such as glomerulonephritis, diseases and disorders involving disruption of endocytosis and/or antigen presentation, cytokine clearance and/or inflammation, viral infection, pathogenic bacterial toxin contamination, elevation of free fatty acids or hypercholesterolemia, type 2 diabetes, osteoporosis, Alzheimer's disease and cardiovascular disease. Products from the present invention
                                                                                                                                                                                                                                                                                                                                                   The present invention describes LRP5 (low density lipoprotein (LDL) receptor related protein, previously designated LRP-3). AAV85587 to AAV85822 represent exon primers used for obtaining LRP5 cDNA. Nucleic acid molecules (NAMS) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (LDDM). The NAMS or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated LDL-receptor related protein - used to develop products treating, e.g. elevated triglyceride levels, diabetes, autoimmune disorders, inflammation or Alzheimer's disease.

They may be used, e.g., for modulation of the ras gene and may be able to modulate the process of transformation from normal to malignant cell growth. They may be prepared using known methods. Inclusion of the aminooxy moietles can improve binding of oligonucleotides to complementary strands. The moieties can also provide conjugation sites useful for conjugation of useful ligands (e.g. reporter groups and groups for modifying uptake, distribution or other pharmacodynamic properties) to oligonucleotides. The present sequence represents an example of an aminooxy-modified oligonucleotide disclosed in the specification

control matrices and matrices of this inventions is played by the ion concernable permeation layer which overlies the electrode. This permeation concernable permeation layer which overlies the electrode. This permeation concernable permeation layer which overlies the electrode. This permeation concernable permeation layer allows attachment of nucleic acids to permit immobilization but concernable attached to settone and hybridized target DNA contends from the highly reactive electrochemical environment generated contends and fabricated to actively carry out and control reactions such concernation, diagnostics and biopolymer synthesis. The device can concentrated to actively carry out and control reactions contends and the transport and attachment of specific microconcernable contends and polypeptides, to specific microconformallytes or reactants at the addressed specific microconformallytes or reactants at the addressed specific microconcernate analytes and reactants, remove non-conformallytes and reactants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ₹,

The primers are used to amplify gene sequences to generate information necessary to compile haplotype profiles The haplotype profiles can be used to detect presymptomatic and symptomatic glaucoma. They can also be used to localise, isolate and identify the GLC1B and GLC6p25 loci so that detection of individuals with glaucoma is enhanced. The haplotype analyses also provide means for identification and following of mutant alleles in pedigrees or populations. Identification of presymptomatic individuals using the methods allows intervention in the disease process and obviates the impact of inheriting a mutant allele causing disease, by medically disrupting the initiation or progression of the disease
                                                                                                                                                                                                                                                                                                                                                                                       Enzyme-specific cleavable polynucleotide substrate; quenched fluorescent moiety; biological assay; detection; identification; microorganism; sterilization assurance; nuclease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a PCR primer used in the method of the invention. The method is for detecting the presence of alleles for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                pharmaceutical discovery, enzyme assays, immunoassays and other biological assays. The method provides a rapid and convenient approach for detection and identification of microorganisms. It can be adapted to sequence-dependent tests. The invention provides improved accuracy, faster detection, and overall lower cost in detection and identification of microorganisms. The presence of nuclease is measured more accurately and sensitively by red-shifting the emission wavelength from far UV region (350-400 nm) to the 500-600 nm region of the electromagnetic spectrum and reducing the effect of background signal levels of intact reagents. The present sequence is used in the course of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The specification describes an enzyme-specific cleavable polynucleotide substrate bearing quenched fluorescent moieties. The enzyme-specific cleavable polynucleotide substrate is useful in biological assays for detection and identification of microorganisms, sterilization assurance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  An enzyme-specific cleavable polynucleotide substrate bearing quenched fluorescent moieties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             09-JAN-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Best Local Similarity Matches 17; Conserv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          at a PG1-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate cancer. Early-stage diagnosis of prostate cancer relies on prostate specific antigen (PSA) dosage. However, the effectiveness of this is limited due to its inability to discriminate between malignant and non-malignant affections of the organ. A need exists for both a reliable diagnostic procedure which would enable early-stage diagnosis, and for preventative and curative treatments of the disease. The PG1 gene can be used for detection of prostate cancer, and the risk of developing it in the future, and can also be used to determine therapies for the disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a mammalian PG1 gene and protein, and a set of PG1 biallelic markers. The PG1 polynucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allelespecific amplification assay for determining the identity of a nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        detection of prostate cancer, and the risk of develor

The modified oligomeric compounds have increased binding affinity and increased nuclease resistance. The oligomeric compounds can be used in diagnostic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents an uniform phosphodiester oligonucleotide. The specification describes oligomeric compounds containing 2'-O-modified ribosyl nucleosides. The 2'-O-modified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel 2^{\prime}-O-aminoethyloxyethyl modified nucleosides and oligonucleotides used in diagnostic, therapeutic and research reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 2000-205668/18

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             structures that position the sugar moiety of the nucleosides preferentially in 3' endo geometries. The modified oligomeric componer increased binding affinity and increased nuclease resistance. oligomeric compounds can be used in diagnostic, therapeutic and response to the sugar properties of the sugar properties of the sugar properties of the sugar models.
                                                                                                                                                                                    The present invention is concerned with methods of determining the nuclease stability of oligomeric compounds using capillary-gel electrophoresis and laser-induced fluorescence. The methods are us the polymerase chain reaction (PCR), molecular cloning and disease diagnosis and treatment. The present sequence was used in a demons:

                                                                                                                                                                                                                                                                                                                        This sequence represents a modified oligonucleotide used in the course of the invention. The invention relates to oligonucleotides comprising nucleotides covalently linked together by internucleotide linkages where at least 1 nucleotide is linked to adjacent nucleotide by a 2',5-internucleotide is allowed to adjacent nucleotide by a 2',5-internucleotide by a 2',5-internucleotide by a 2',5-internucleotide in gene therapy and are also useful in antisense methodologies, diagnostics, therapeutics and as research reagents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel modified oligonucleotides, useful in antisense methodologies, diagnostics, therapeutics and as research reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 misc_RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      misc_feature

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modified oligonucleotide
                                                                                                                                                                                                                                                                                                                                               This sequence represents a modified oligonucleotide used in the course of the invention. The invention relates to oligonucleotides comprising nucleotides covalently linked together by internucleotide linkages where at least 1 nucleotide is linked to adjacent nucleotide by a 2'.5'.
                                                                                                                                                                                                                                                                                    Sequence 19
                                                                                                                                                                                                                                                                                                                                                                                                            Example 54; Page 59; 75pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                   diagnostics, therapeutics and as research reagents.

2'-deoxy-erythro-pentofuranosyl sugar moiety; nuclease resistant;
hybridisation; binding affinity; ss.
                                                                                                                                                                                                                                                                                                         internucleotide linkage and bears a 3'-substituent. The oligonucleotides can be used in gene therapy and are also useful in antisense methodologies, diagnostics, therapeutics and as research reagents
                                                  Modified T-containing oligonucleotide,

It also relates to
CC oligonucleotides wherein at least some of the nucleotides are
CC functionalised to be nuclease resistant, at least some of the nucleotides
CC include a substituent that potentiates hybridisation of the
CC oligonucleotide to a complementary strand, and at least some of the
CC oligonucleotide to a complementary strand, and at least some of the
CC oligonucleotide a 2'-deoxy-crythro-pentofuranosyl sugar moiety. The
CC provides for improved binding of such oligonucleotides
CC provides for improved binding of such oligonucleotides to a complementary
CC strand. The oligonucleotides of the invention aare used as diagnostic,
CC therapeutic or research reagents, and can be used to modulate gene
CC expression in organisms. The oligonucleotides containing the modified
CC nucleosides have increased nuclease resistance and increased binding
CC oligonucleotide containing nucleotides substituted with a 2'-O-{2- [N-(2-
amino)ethyl-N-(methyl)]aminooxyethyl} group

                                                                                                                             oligonucleotide ISIS 22115 contains a mixed phosphodiester and phosphorothioate backbone and has 2'-O-(2-methoxyethyl) Chemistry. It was used in experiments to determine the effects of snake venom phosphodiesterase and liver homogenate on the stability of oligonucleotides. Novel oligonucleotides of the invention have both A-and B-form conformational geometry. The A-form geometry modulates the binding affinity and nuclease resistance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections, and in various
                                                                                                                                                                                                                                                                                                    New oligonucleotides containing sequences with A and B geometry, treat and diagnose e.g. psoriasis, skin cancers and viral, fungal bacterial infections, bind to single stranded RNA or DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                misc_RNA

RESULT 1725 AAA88965

```
geometry modulates the binding affinity and nuclease resistance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           modified_base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic.

                               Oligonucleotide ISIS 22112 contains a phosphorothioate backbone and has 3'-O-(2-methoxyethyl) chemistry. It was used in experiments to determine the effects of snake venom phosphodiesterase and liver homogenate on the stability of oligonucleotides. Novel oligonucleotides of the invention have both A- and B-form conformational geometry. The A-form geometry modulates the binding affinity and nuclease resistance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for NNase-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       dermatological; diagnosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                05-MAR-2001

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             stability of oligonucleotides. Novel oligonucleotides of the invention have both A- and B-form conformational geometry. The A-form geometry modulates the binding affinity and nuclease stance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 19
New oligonucleotides containing sequences with A and B geometry, u treat and diagnose e.g. psoriasis, skin cancers and viral, fungal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oligonucleotide; nuclease resistance; psoriasis; antipsoriatic; dermatological; cytostatic; virucide; antibacterial; fungicide; therapy;

Novel oligonucleotides of the invention have both A-and B-form conformational geometry. The A-form geometry modulates the binding affinity and nuclease resistance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for RWase-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections, and in various
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oligonucleotide ISIS 22114 contains a mixed phosphodiester and phosphorothioate backbone and has 3'-O-(2-methoxyethyl) chemis
                                                                                                                                                                                                                                                                                                                                                        Synthetic.

It was used in experiments to determine the effects of snake venom phosphodiesterase and liver homogenate on the stability of oligonucleotides. Novel oligonucleotides of the invention have both A- and B-form conformational geometry. The A-form geometry modulates the binding affinity and nuclease resistance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections, and in various diagnostic applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New oligonucleotides containing sequences with A and B geometry, utreat and diagnose e.g. psoriasis, skin cancers and viral, fungal bacterial infections, bind to single stranded RNA or DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   modulates the binding affinity and nuclease resistance of the oligonucleotide. The B-form geometry allows the oligonucleotide to serve as substrate for RNase-H when bound to a target nucleic acid strand. The oligonucleotides can be used to treat psoriasis and other inflammatory skin conditions, skin cancers and viral, bacterial and fungal infections,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      O-(2-methoxyethyl) chemistry. It was used in experiments to determine the effects of snake venom phosphodiesterase and liver homogenate on the stability of oligonucleotides. Novel oligonucleotides of the invention have both A- and B-form conformational geometry. The A-form geometry
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New oligonucleotides containing sequences with A and B geometry, used treat and diagnose e.g. psoriasis, skin cancers and viral, fungal and bacterial infections, bind to single stranded RNA or DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Oligonucleotide ISIS 22111 contains a phosphodiester backbone and has o-(2-methoxyethyl) chemistry. It was used in experiments to determine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Manoharan
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               03-MAY-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             03-MAY-2000; 2000WO-US011913

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel synthetic method (M) comprising: (a) providing a sample comprising a number of oligomers of formula (I); (b) contacting the sample with a deprotecting agent to remove R t groups from the oligomers; and (c) reacting the oligomer with a cleaving reagent. The method is used to produce oligomeric compounds for use in antisense and oligonucleotide therapies. The method enables the synthesis of oligomers with a reduction in the number acrylonitrile groups attached.

Acrylonitrile has been demonstrated to be a potent carcinogen in rats. This sequence represents a phosphorothioate 20-mer primer which is used in the method of the synthesis.
         The present invention is concerned with the cleavage of nucleic acids from solid supports. This is carried out by adding a non-conventional nucleotide into the nucleic acid attached to the support, so that it is recognised and cleaved by a specific DNA glycosylase and the sequence is released. This is useful in many molecular biological procedures such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel method for the production of oligomers with reduced exocyclic adducts comprises treatment with deprotecting and cleaving reagents.
                                                                                                                                   Detaching nucleic acid molecule comprising unconventional nucleotide incorporated at predetermined site from a solid support involves cleaving the nucleic acid molecule at the site of unconventional nucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    07-FEB-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid cleavage; solid support; DNA-RNA hybrid;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             based assays, mutagenesis procedures, nucleic acid purification and affinity chromatography. The present sequence is an oligonucleotide used in assays to demonstrate the methods of the invention
                                                                                                                                                                                 Guanidinium functionalized oligomers prepared from units, are hybridizable with a specific RNA or DNA diagnostic and therapeutic purposes.
                                                                                                                                                                                                                                                                                                                                                                                                                              Oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAF31458
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 19 BP; 0 A; 0 C; 0 G; 18 T; 1 U; 0 Other;
                                                                                    Sequence 19 BP; 0 A; 0 C; 0 G; 19 T; 0 U; 0 Other;
                                                                                                         diagnostic and investigative purposes
                                                                                                                   The present invention relates to nucleotide oligomers comprising monomer units. Oligomers modulate gene expression when hybridized by a single- or double-stranded nucleic acid. They are useful for gene therapy,
                                                                                                                                                                                                                                                    Manoharan M,

CC antisense oligonucleotides to nucleotide sequences encoding groE. More CC generally, antisense compounds (1) comprising antisense oligonucleotides of 5-50 bases targeted to a nucleotide sequence encoding groE. More CC of 5-50 bases targeted to a nucleotide sequence encoding groEL (heat CC shock protein (HSP)60) (GL) and groES (HSP10) (GS) gene from a CC microorganism, where the antisense compound is complementary to GL or GS of a microorganism and specifically hybridises with and inhibits the CC expression of GL or GS, is claimed. (I) have antibacterial, antiviral and CC for inhibition expression of GL or GS in cells or tissues in vitro. (I) are also useful for inhibiting the growth of a microorganism, or inhibiting the expression of GL or GS gene in a microorganism, or inhibiting the expression of GL or GS gene which involves administering to the microorganism or to a cell infected with the microorganism, (I). (I) are also useful for treating a mammalian pathological condition mediated by microorganisms having a GL or GS gene which involves administering to the having a pathological condition mediated by microorganisms having a GL or GS gene and administering (I) such that the growth of microorganism is consisted. The antisense compounds are utilised for diagnostics, therapeutics, prophylaxis and as research reagents and kits, e.g., to prevent or delay microbial infections in humans. They are also useful as molecular weight markers. AAH56362 to AAH56367 and AAH56833 to AAH56854 cemplification of the present invention. AAH56855 to AAH56870 represent CC exemplification of the present invention. AAH56855 to AAH56870 represent

The present invention CC includes kits for determining the presence or absence of a SNP, using the CC oligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPB primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by coligonucleotides are useful for determining the presence, absence or CC oligonucleotides are useful for determining the presence, absence or CC identity of a SNP and for genotyping nucleic acid sample by coligonucleotides are useful for determining the presence, absence or CC assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being CC aused by one or more SNPs. Phenotypic traits include diseases e.g. CC osteogenesis imperfects and acute intermittent porphyria. Phenotypic CC traits also include symptoms of or susceptibility to multifactorial diseases of which a component is or may be genetic such as autoimmune CC disease of which a component is or may be genetic such as autoimmune inference of the matting, rheumatoid arthritis, multiple sclerosis, and concernity analysis. The method is also useful in forensic investigations and concernity analysis. The present sequence represents a PCR primer specific for a burnar, SNP containing NNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁

agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune disease, including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a PCR primer specific for a human SNP containing DNA sequence
                                                                                                                                                                                                                                                                                                              Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPB) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPB. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic trait suspected seeses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 1; Page 63; 83pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  acid sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New genotyping oligonucleotide, useful for detecting the presence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Picoult-Newburg L,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          absence or identity of single polynucleotide polymorphism in a nucleic

The method comprises phosphitylating the 5'-hydroxyl of a nucleic acid group having at least one nucleoside with a 2' modification in an acetonitrile. The present sequence was used to illustrate the method of the present invention. The method is useful for synthesising sulphurised 2' substituted phosphorothioate oligonucleotides, which may be used in molecular biological research, in applications such as anti-viral therapy, and for determining the stereochemical pathways of certain enzymes which recognise nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Preparing sulfurized 2' substituted phosphorothioate oligonucleotides useful in biological research, comprises phosphitylating the 5'-hydrosof a nucleic acid having a nucleoside with a 2' modification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 05-JUN-2001.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 19
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides a number of DNA-RNA oligonuclectides which can act as substrates for human RNase HI (a type II RNase). The sequence consists of two portions, one of which is capable of supporting cleavage of a complementary target RNA and the other of which is incapable of supporting such cleavage. These can be used to enhance the effectiveness of antisense therapies. The present sequence is an RNase H substrate used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Crooke

The sequence consists of two portions, one of which is capable of supporting cleavage of a complementary target RNA and the other of which is incapable of supporting such cleavage. These can be used to enhance the effectiveness of antisense therapies. The present sequence is an RNase H substrate used in the exemplification of the invention
                                                       patient sample. identification of the development o
                                                                                  PCR primers AAC62163-64 were used to amplify a human apolipoprotein CI (APOCI) allele. The primers are used in the method of the invention. The specification describes a method for screening for a genetic factor for having an enhanced risk of developing Alzheimer's disease. The method comprises amplifying the genomic DNA encoding an APOCI region in a patient sample. The method is useful for early screening or identification of Alzheimer's disease, and for monitoring the presence of identification of Alzheimer's disease, and for monitoring the presence of
                                                                                                                                                                                                                                                                                                                                                                                Screening for a genetic factor for having an enhanced risk of developing Alzheimer's disease (AD), useful for identifying and monitoring the presence or development of AD, by amplifying the DNA encoding an apolipoprotein CI region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAC62164 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 19 BP; 0 A; 0 C; 0 G; 18 T; 1 U;

The primers are used in the method of the invention. The specification describes a method for screening for a genetic factor for having an enhanced risk of developing Alzheimer's disease. The method comprises amplifying the genomic DNA encoding an APOCI region in a patient sample. The method is useful for early screening or
